

UNI System 8

HANDS-FREE CAR KITS

Connecting units:

UNI System 8 - the principle

1. Select the base unit and install it in the car
2. Use connecting unit, depending on individual requirements
3. Telephone conveniently and safely

The universal **UNI System 8** hands-free car kits (**base units and connecting units**) were developed in order to guarantee maximum flexibility for mobile communication. With the UNI System 8, if you wish to exchange your mobile phone for the latest model, there's no need for any additional installation. You can keep your previously installed base unit and if required, simply exchange the cradle, which only takes a few seconds. If you already have a connecting unit that uses Bluetooth technology, when you change your mobile phone, you can continue to use your complete hands-free car kit. The UNI System 8 is so flexible that it can also be combined with a navigation system. This synthesis is called **naviflash talk**, a compact **car infotainment system** with a unique range of functions in the areas of mobile communication and navigation.
